polycarboxylate superplasticizer concrete admixture

polycarboxylate superplasticizer concrete admixture is a new generation of environmental protection superplasticizer independently developed by our company. It is a water-soluble superplasticizer based on carboxylic acid grafted polymer. It has no stratification, no precipitation and no crystallization in winter.

With super plasticizing, high slump, high reinforcement, low shrinkage characteristics, can prepare different strength of concrete.

Especially suitable for the configuration of high strength, high flow, self-compacting, high durability, high performance concrete.

What is the function of polycarboxylic acid water reducer in engineering

polycarboxylate superplasticizer concrete admixture is used in construction work to a kind of chemical agents, he can be a good function of the dispersion of cement structure, main function is to make the concrete plasticizing effect, prevent loss of concrete slump,

make concrete has better performance, at the same time also delay the condensation rate, won't make concrete,

Very in line with the construction requirements of modern engineering and construction, so the emergence of polycarboxylic acid water reducer is undoubtedly to bring a great boost to the present project.

Polycarboxylic acid water reducer is a new era of concrete mixing agent, its composition does not have too many harmful substances, safety and health, in some of the existing projects have such admixtures, adding admixtures after the whole building can present a better building performance.

Now the admixture is an indispensable link in the project, in order to better meet the requirements of the building then adding different admixtures is very correct means, if your project just encountered a similar problem, you can call to consult us.
